

Students, the quiz and writing assignment for this module will consist of a practicum. First you need to make a “selfie” either a video or series of photos of yourself giving a subcutaneous and intramuscular injection. Demonstrate how you would prepare a syringe and fill it with saline and use an injectable object (orange, apple, stuffed animal) to demonstrate the proper technique to give a subcutaneous and intramuscular vaccination. Secondly, I would like for you to conduct a health check on an animal. If a dog, cat or livestock is available (human friend if animal is not available) collect and submit vital signs; appearance of mucous membranes, respiration, heart rate, temperature, gut sounds, body condition score. Thirdly, you have a piece of “flesh” in your lab kit that has a wound that needs suturing. Submit a video or photos of your stitched wound. We have posted on the course site some help aids for making and submitting videos and or powerpoint presentations. This assignment is not due until March 30, 2015.
